

Mapping the journey to cyber security

A global insurance group needed to ensure they had a robust strategy to manage their cyber security risks whilst enabling the major IT and Digital transformation the business was undertaking. We helped develop a comprehensive cyber security strategy to support the insurer's ambition to build a modern digital business and maintain customer trust.

We assessed the insurers existing cyber security capability across people, process and technology domains; critically the assessment was conducted in the context of their threat landscape – working with the business to understand critical assets and processes, we examined the capabilities and motivations of their internal and external threat actors. We also helped our client understand how they compared with peers in the insurance sector and then also to the banking sector. This overall approach provided a solid foundation from which to develop a new target state, with a clearly defined risk appetite, and a fit-for-purpose cyber strategy to deliver it.

Our client now has a clear strategic direction, a clear plan for implementation and a clear understanding of their cyber risk appetite. Their objectives of delivering a threat-led and risk-based transformation, whilst embedding a secure culture, and building and maintaining customer trust draws closer.

We are on your side all the way.
