**Recent economic developments** – The International Monetary Fund (IMF) was earlier in 2017 expecting economic growth of only 2% during the year, but revised higher this figure during October to 2.8% as the country’s cereal production is estimated to have increased threefold in the 2016/17 farming season. Zimbabwe recently witnessed a change in its leadership after the resignation of long serving President Robert Mugabe in November 2017 after 37 years in power. The change, which saw the swearing in of Emmerson Mnangangwa as the country’s new president, with this change in its leadership, makes the country a prime destination for foreign investment in the medium-to-long term.

Zimbabwe’s proximity to South Africa is beneficial for trade. Zimbabwe offers a number of tax incentives to new foreign investors, particularly to investors in special economic zones. Despite the recent resignation of President Robert Mugabe the political environment has remained relatively stable since 2009. Zimbabwe’s economic snapshot is beneficial to trade.

**The country’s coordination with the UN on intellectual property initiatives has the potential to improve investor protection.**

**Government’s fight against corruption could raise attractiveness for foreign investors.**

**One Stop Shop which improves the turnaround time for applying for business licences and getting information on Zimbabwe.**

**A new government is currently being formed with high expectations regarding policy reforms to turn around the economy.**

**A lack of clear guidelines surrounding the country’s ‘Indigenisation’ Act and the use of US-dollar pegged bond notes will likely continue to deter foreign investment in the medium-to-long term.**

**An efficient environment will remain challenging.**

**Deter foreign investment in the medium-to-long term.**

**Intellectual property rights infringements go largely unpunished.**

**A highly volatile economic environment with a lot of uncertainties regarding currency.**

**The country goes for general elections in 2018 and previous elections have been characterised by disagreements among the contestants.**

**Economic structure** – The primary sector in Zimbabwe is integral to the country’s economy as it employs the majority of residents. The agricultural sector is focussed on tobacco (for export) and food crops (for domestic consumption). The secondary sector is of importance for Zimbabwe’s economic development, since mining brings in half of the country’s export earnings through the extraction of precious and other metals. The tertiary sector is largely dependent on primary industrial activities (such as farming and mining) as well as manufacturing, is susceptible to problems that have seen companies lay off many of workers or shutting down over the past two years. The tertiary sector is the largest in the country and makes up 57% of gross domestic product (GDP). According to the World Travel and Tourism Council (WTTC), the total contribution of tourism was 8.1% of GDP in 2016.

**Opportunities**

**Threats**
Headline inflation increased from 0.1% y-o-y in August 2017 to 0.8% y-o-y in September, though Zimbabweans claim a wide disparity between data reported by the Zimbabwe National Statistics Agency (Zimstat) and on-the-ground developments. While the disparity between inflation measurements and perceptions has been a concern for some time, the problem has been amplified by the depreciation in value of bond notes.

### Economic policy

The Zimbabwe Agenda for Socio-Economic Transformation (Zim Asset) 2013-2018 is the country’s plan to achieve sustainable development and social equity through indigenisation, empowerment and employment creation. The plan is currently in its second phase (2016-2018). The agenda is built around four strategic clusters, namely: 1) food security and nutrition, 2) social services and poverty eradication, 3) infrastructure and utilities, and 4) value addition and beneficiation. The strategies envisioned under Zim Assets include: 1) investing in sustainable food security solutions; 2) increasing economic opportunities for women and the youth; 3) expanding the accessibility and utilisation of ICT; 4) building and rehabilitating infrastructure and utilities; 5) establishing SEZs; and 6) recapitalising and capacitating development finance institutions, amongst others. Although the country has not made much progress in the implementation of the current strategy, a follow-up Zim Asset II is currently under development for the period 2019-2023. It is however important to note that these policies are likely to be revised with the new government that is being formed by Mr E D Mnangagwa.

### Macroeconomic overview

![Economic structure (% of GDP), 2016](image)

Source: African Economic Outlook (AEO)
Economic growth – The Zimbabwean economy mounted a fragile recovery in 2017 on the back of improved rainfall boosting crop production. In fact, earlier this year, the IMF expected growth of only 2%, but revised this figure to 2.8% in October 2017. The country’s cereal production is estimated to have increased threefold in the 2016/17 farming season and is expected to grow further during the 2017/18 farming season. Zimbabwe recently witnessed a change in its leadership following the resignation (following influence from the military) of long serving President Robert Mugabe in November 2017 after 37 years in power. The change, which saw the swearing in of Emmerson Mnangagwa as the country’s new president, with this development expected to usher in new economic development and improve investor’s sentiments towards the country. The change in the country’s leadership before elections (which are due to be held in the third quarter of 2018) has brought new hope in the country for an economic turnaround.

Sources: IMF, United Nations Conference on Trade and Development (UNCTAD)

Foreign investment – BMI currently ranks Zimbabwe 43rd out of 48 states in Sub-Saharan Africa and 191st out of 201 countries worldwide for trade and investment attractiveness. Ministry of Macro-Economic Planning and Investment Promotion Permanent Secretary Judith Kateera commented in October 2017 that the creation of SEZs are expected to attract foreign direct investment (FDI) and translate into export-led economic growth in the landlocked country. The government adopted the SEZ Act in October 2016 and rolled out consultative meetings and sensitisation workshops for stakeholders in the latter part of 2017. The SEZs will offer investors tax and administrative benefits and incentives. Additionally, foreign investors will not have to comply with the indigenisation laws within the SEZs, which is bound to promote FDI in Zimbabwe. The government has been implementing a rapid response initiative to oversee the implementation of the country’s Zim-Asset and improve the conditions of doing business in Zimbabwe. This initiative has been prioritised and is being spearheaded together with the president’s office.

External trade – Zimbabwe’s current account shortfall declined (as percentage of GDP) during 2015-2016 as the country’s volume of exports increased by a cumulative 22.2% while the volume of imports increased by a cumulative 3.2%. This was as a result of the government issuing Statutory Instrument 64 which restricted imports of certain materials which are locally available in the country. More recently, the Tobacco Industry and Marketing Board (TIMB) measured the country’s tobacco crop at 185.6 million kilograms during 2017, sold at an average price of $2.97/kg. Premier Tobacco Auction Floors expected tobacco exports to increase in value from $933 million in 2016 to $980 million in 2017. The improved harvest supported a smaller current account deficit (as percentage of GDP) during the year, and contributed to a rise in export revenues during 2017 – the first increase since 2011. The outlook for 2018 is for a further narrowing of the current account deficit to 0.8% of GDP: this will be the smallest shortfall since 2003. The IMF does not expect Zimbabwe to see a current account surplus over the next five years. BMI projected import cover - the number of months of imports covered by a country’s foreign reserves - to equal just 0.4 months in 2018, compared to a global benchmark of at least three months.
Fiscal policy – The IMF predicted Zimbabwe’s fiscal position to recover modestly from 2016 towards 2018. This is based on expectations of a decline in staff costs during 2018: the IMF indicated in a statement during July 2017 that efforts to freeze government salaries and public sector hiring were underway in Harare. Nonetheless, the multilateral organisation warned at the same time that “fiscal imbalances have become unsustainable” due to limited inflows of foreign financing. As a result, the government has restarted the issuing of Treasury Bills to commercial banks in order to finance its funding shortfall. Banks are struggling to convert these notes into cash and fear a payment default by the state. As a result, while state finances receive a boost from the issuance of debt instruments, the banking system and economy as a whole is starved of cash. From a public debt perspective, the government has settled its outstanding debt payments to the IMF, but has yet to reach an agreement with the World Bank and other multilateral institutions on the settling of arrears. Reserve Bank of Zimbabwe (RBZ) Deputy Governor, Jesimen Chipika, said in October 2017 that the central bank decided to delay the settlement of these debts despite the earlier announcement of secured funding to clear a combined $2 billion owed to the World Bank and African Development Bank (AfDB). He indicated that the benefits to be gained from this repayment will be limited at present as the country is still in the process of meeting other non-financial conditions set out by creditors. These include reforms to the local business and investment environment.

Monetary policy – Official data indicates that Zimbabwe moved from a period of disinflation in 2015-2016 to price growth during 2017. Headline inflation increased from 0.1% y-o-y in August 2017 to 0.8% y-o-y in September, though Zimbabweans claim a wide disparity between data reported by Zimstat and on-the-ground developments. From a cost of living perspective, the average monthly salary in Zimbabwe is 80% lower than in Johannesburg, South Africa, while the cost of groceries are almost 25% higher in US dollar terms. While the disparity between inflation measurements and perceptions has been a concern for some time, the problem has been amplified by the depreciation in value of bond notes against the greenback in informal markets. Zimbabweans have been averse to using bond notes due to the fear that the pseudo currency will again cause hyperinflation less than a decade after skyrocketing prices led to the demise of the Zimbabwean dollar. This has also resulted in a dearth of cash in the economy as consumers and businesses hoard any hard currency that they can get hold of. As a result of these dynamics, bond notes have lost a significant portion of their value, translating into Zimbabweans needing to spend a lot more than Zimstat data would suggest. The government banned the import of fruits and vegetables during October 2017 in order to reduce the outflow of foreign currency from the country, while poultry imports from key supplier South Africa is also currently banned due to an avian flu outbreak. The ban on these basic food commodities is part of the reason why the IMF expects a significant rise in average headline inflation – as measured by Zimstat - during 2018 to 9.5%.
